THE PROCESS STORY

“Why should I choose extruded horse feed for my horses?”

Benefits of extruded feed:

- Improves digestibility and energy availability.
- Makes starches and carbohydrates more available.
- Controls the texture and density of the feed.
- Improves protein digestibility.
- Destroys the biological activity of toxic enzymes in protein.
- Extrusion improves the shelf life of the feed.
- Increased nutrient availability means less feed is required.

Martin extruded horse feeds are “cooked” through the process of extrusion in much the same way as many of the foods we eat are made. Extrusion gelatinizes (cooks) the starches in the grains which assists in the manufacturing process, transforming the ingredients into a more readily available source of energy for maintaining a higher level of endurance. By creating an overall improvement in nutrient digestibility, extrusion results in a reduction in total feed requirements and a decrease in incidents of digestive disturbances, with the added benefit of allowing the natural fats contained in the grains to produce a healthier coat of hair.

Premium quality feeds are produced by Martin’s using premium quality ingredients and feed additives such as Yea-Sacc®, Bioplex® and Sel-Plex®. The extruded line of horse feeds also feature “fixed-formula diets” that do not change according to commodity pricing, ensuring a consistent product.

All Martin Mills Inc. Horse Feeds and Special Moments contain added selenium at 0.3 mg/kg.

Feed with quality pasture or hay forage and always provide fresh water.
